40 AI TOOLS

Click-by-Click Solution Guide

Practical walkthroughs for coding, automation, data analysis, education, diagrams, forms, websites, RAG, and AI agents.

How to use this guide

1. Open the official website linked on the tool's page.
2. Sign in or create an account if the service requires it; available features may vary by plan.
3. Follow the numbered instructions and use the example prompt as a starting point.
4. Test the output with sample data and refine it if needed.
5. Verify accuracy, privacy, permissions, and costs before sharing or deploying anything.

Interface note: AI tools update their menus and features frequently. Button labels may differ slightly from the wording in this guide. The steps focus on the typical workflow and the checks needed to complete each activity.

Safety note: Use practice data first. Do not upload passwords, API keys, confidential company documents, identifiable student records, or customer information unless the service and your organization permit it.

Quick Index

Tool	Category	Official website

Cursor

AI coding assistant

Official website: https://cursor.com/

Activity / goal

Understand and improve a Python project

Example prompt or task

“Review this project. Explain the folder structure and identify the entry point. Suggest one small improvement before editing anything.”

Solution steps — follow in order

1. Open https://cursor.com/ and download/install Cursor for your operating system if needed.
2. Launch Cursor. Choose Open Folder and select a practice project folder. For a first try, create a folder with a small Python file.
3. Open the relevant file in the editor. Use the chat/AI panel available in your version and paste the example prompt.
4. Read the proposed explanation first. If you want a change, ask for one specific edit and inspect the suggested diff before accepting it.
5. Run the program or tests in the integrated terminal. If an error appears, share the error text and ask for a minimal fix.
6. Save the changes and check that no API keys, passwords, or private files are included in the project.

Important check: AI-generated edits can be wrong. Review diffs and test code before using it.

GitHub Copilot

AI coding assistant

Official website: https://github.com/features/copilot

Activity / goal

Generate unit tests for a Python function

Example prompt or task

“Write unit tests for this function covering a normal input, an empty input, and an invalid input. Explain what each test checks.”

Solution steps — follow in order

1. Open the official GitHub Copilot page and choose the setup path for your IDE or GitHub account.
2. Install the supported extension in your IDE, sign in, and confirm the feature is enabled for your account.
3. Open a practice code file and select the function you want to test.
4. Open the Copilot chat or inline prompt feature and paste the example prompt along with the function code.
5. Review the generated tests. Ask it to include expected results and explain any assumptions.
6. Run the tests locally. Correct failures, and review the final code for security and maintainability.

Important check: Suggestions are not guaranteed to be correct; always run tests and review the code.

Replit

Browser-based coding and app deployment

Official website: https://replit.com/

Activity / goal

Build an expense tracker prototype

Example prompt or task

“Build a simple expense tracker with date, category, amount, and notes. Show monthly totals and validate that amount is numeric.”

Solution steps — follow in order

1. Open Replit and sign in or create an account if required.
2. Choose the option to create a new app/project. Select a suitable template or use the available AI app-building workflow.
3. Describe the purpose, required fields, calculations, and expected screen using the example prompt.
4. Review the generated files and use the Run/Preview control to launch the app.
5. Enter sample expenses, test monthly totals, and try empty or invalid amounts. Ask for targeted fixes when needed.
6. Before publishing, inspect storage, sharing, authentication, and deployment settings. Publish only sample data until security is reviewed.

Important check: Check hosting costs, access settings, and how the app stores user data before deployment.

Lovable

Prompt-based web app builder

Official website: https://lovable.dev/

Activity / goal

Create a college event registration page

Example prompt or task

“Create a responsive college event registration page with event details, a registration form, validation, and a confirmation screen. Use sample data only.”

Solution steps — follow in order

1. Open Lovable and start a new project.
2. Enter the example prompt, replacing college/event details with a practice scenario. Specify the audience and visual style if useful.
3. Wait for the first app version, then inspect the page preview and generated sections.
4. Use follow-up prompts for focused changes, such as clearer form labels, mobile layout, or validation messages.
5. Test the form with valid, missing, and invalid entries. Check the confirmation screen and links.
6. Before using real registrations, review database access rules, authentication, privacy, and deployment configuration.

Important check: A prototype is not automatically production-secure; review backend permissions before collecting real data.

Bolt.new

Prompt-based app builder

Official website: https://bolt.new/

Activity / goal

Build a task manager

Example prompt or task

“Build a task manager with task title, priority, due date, completion status, and filters. Start with sample data and explain how to run it.”

Solution steps — follow in order

1. Open Bolt.new and start a new project.
2. Paste the example prompt and specify any preferred technology or layout if you have one.
3. Let the app generate, then inspect the preview and file structure.
4. Try creating, completing, filtering, and editing tasks. Test empty fields and invalid dates.
5. Ask for one correction at a time, then retest the relevant feature.
6. Review dependencies, storage, secrets, and access permissions before publishing or connecting real data.

Important check: Inspect generated dependencies and security settings before using the app with real users.

v0

UI generation for developers

Official website: https://v0.dev/

Activity / goal

Create a training dashboard interface

Example prompt or task

“Create a responsive dashboard for a training program with KPI cards, a participant table, a date filter, and an accessible layout.”

Solution steps — follow in order

1. Open v0 and start a new generation/project.
2. Describe the users, dashboard purpose, components, screen size, and desired style.
3. Generate the first UI and inspect the preview.
4. Ask for targeted refinements to labels, spacing, mobile responsiveness, and empty/loading states.
5. Review the generated code and copy or integrate it into your application using the supported workflow.
6. Run the application in its actual environment and test keyboard navigation, responsiveness, and data behavior.

Important check: Generated UI code may require integration and accessibility review.

n8n

No-code workflow automation

Official website: https://n8n.io/

Activity / goal

Notify a team when a spreadsheet row is added

Example prompt or task

“When a new row is added to a spreadsheet, validate the email field, send a notification, and log success or failure.”

Solution steps — follow in order

1. Open n8n and create a new workflow.
2. Add a trigger node for the source app or event. Connect credentials using the built-in credential mechanism, not pasted passwords.
3. Add a validation or condition node, then add the notification action and a logging/error-handling step.
4. Connect the nodes and map the correct fields from the trigger output to the action.
5. Run a manual test with sample data and inspect each node's input/output. Test a missing or invalid email too.
6. Activate the workflow only after confirming permissions, duplicate handling, error alerts, and the destination of notifications.

Important check: Protect credentials and test carefully before activating workflows that send messages or modify records.

Make

Visual workflow automation

Official website: https://www.make.com/

Activity / goal

Create a task from a form response

Example prompt or task

“When a form response arrives, create a project task and send a confirmation email containing the submitted topic.”

Solution steps — follow in order

1. Open Make and create a new scenario.
2. Add the trigger module for the form or source application and connect the account.
3. Add an action module for the project/task app, then another for the confirmation email if appropriate.
4. Map each field carefully, and add filters or routes for incomplete responses.
5. Run the scenario once using a test submission. Inspect the execution details and correct field mappings.
6. Schedule or activate only after testing duplicates, errors, access permissions, and operation limits.

Important check: Review operation limits and ensure automatic emails or record updates are appropriate.

Zapier

Business app automation

Official website: https://zapier.com/

Activity / goal

Add event registrations to a spreadsheet

Example prompt or task

“When a new event registration arrives, add the attendee to a spreadsheet and notify the event coordinator.”

Solution steps — follow in order

1. Open Zapier and choose to create a new Zap.
2. Choose the trigger app and event, then connect the approved account.
3. Test the trigger to load a sample registration.
4. Choose the spreadsheet action, select the correct file/sheet, and map name, email, and event fields.
5. Add a notification action if needed, then test each step with sample data.
6. Turn on the Zap after checking duplicates, sharing permissions, task limits, and handling of personal data.

Important check: Use the minimum necessary permissions and avoid automating sensitive decisions without human review.

Microsoft Copilot

Productivity assistant

Official website: https://copilot.microsoft.com/

Activity / goal

Turn project notes into a status update

Example prompt or task

“Turn these non-confidential project notes into a concise status update with completed work, blockers, decisions needed, and next steps.”

Solution steps — follow in order

1. Open the official Copilot website or the approved Microsoft 365 experience available to you.
2. Start a new conversation and paste only notes you are permitted to share.
3. Enter the example prompt and specify whether the update is for a manager, team, or client.
4. Review the draft and ask for a table with item, status, owner, and next action if useful.
5. Compare every commitment, date, and blocker against the original notes.
6. Copy the reviewed version into the approved email or project system.

Important check: Features vary by account and license; follow organizational data policies.

Notion AI

Workspace knowledge and notes

Official website: https://www.notion.so/product/ai

Activity / goal

Turn project notes into a structured page

Example prompt or task

“Convert these project notes into a page with objective, milestones, owner, risks, decisions, and next actions.”

Solution steps — follow in order

1. **1.** Open Notion and create a new page or open an existing project page.
2. **2.** Paste your notes or open the approved workspace material you want to organize.
3. **3.** Use the available AI action to summarize, rewrite, or structure the content; paste the example prompt.
4. **4.** Review the generated headings, tasks, owners, and dates. Replace unknown details with “To confirm.”
5. **5.** Add the page to the correct workspace location and assign tasks only after checking them.
6. **6.** Review sharing permissions before inviting teammates or publishing the page.

Important check: Check workspace permissions and confirm AI-generated dates, owners, and decisions against the source.

Julius AI

AI data analysis

Official website: https://julius.ai/

Activity / goal

Analyze sales data from a CSV

Example prompt or task

“Check this sales CSV for missing values and duplicates, summarize revenue by region, and create a chart. State formulas and limitations.”

Solution steps — follow in order

1. Open Julius AI and start a new analysis/chat.
2. Upload a small, non-sensitive CSV using the file upload option.
3. Explain what the columns mean and state the business question.
4. Ask it to inspect missing values, duplicates, data types, and unusual values before drawing conclusions.
5. Request a summary table and chart, then inspect the output and any generated code or calculations.
6. Verify totals independently and export only the reviewed result.

Important check: AI-generated analysis can be wrong; independently verify important calculations.

Rows

Spreadsheet analysis and reporting

Official website: https://rows.com/

Activity / goal

Create a marketing KPI report

Example prompt or task

“Create a monthly report from this sample table with spend, leads, conversion rate, cost per lead, and a short interpretation.”

Solution steps — follow in order

1. Open Rows and create a new spreadsheet or import a sample dataset.
2. Check column names, date formats, and numeric types.
3. Create or use formulas for conversion rate and cost per lead; ask for help with formulas if needed.
4. Build a summary table grouped by month and add a suitable chart.
5. Check formulas against a hand-calculated example and clarify how missing values are treated.
6. Export or share the report after checking access permissions and the figures.

Important check: Validate formulas and permissions for any connected data sources.

Flourish

Interactive data storytelling

Official website: https://flourish.studio/

Activity / goal

Visualize enrollment trends

Example prompt or task

“Visualize five years of student enrollment by department using a line chart, clear labels, and a source note.”

Solution steps — follow in order

1. Open Flourish and choose a visualization template such as a line chart.
2. Prepare a tidy spreadsheet with one column for year and separate columns or rows for departments.
3. Upload/paste the data and map fields to the chart template.
4. Edit title, axis labels, legend, colors, annotations, and source note.
5. Preview the chart and check that values and time ordering are correct.
6. Publish or export using the available option, and confirm sharing settings.

Important check: Use a chart type and scale that represent the data honestly.

Datawrapper

Charts, tables, and maps

Official website: https://www.datawrapper.de/

Activity / goal

Create a department completion-rate chart

Example prompt or task

“Create a horizontal bar chart of training completion rates by department, sorted highest to lowest, with percentage labels.”

Solution steps — follow in order

1. Open Datawrapper and choose Create visualization, then select a bar chart.
2. Paste or upload a cleaned dataset with department and completion-rate columns.
3. Check the column mapping and sort departments by completion rate.
4. Add a descriptive title, percentage units, source note, and appropriate labels.
5. Preview the visualization and check the values against the source data.
6. Export, embed, or publish using the available options after reviewing visibility settings.

Important check: Double-check scale, sorting, units, and source notes.

MagicSchool AI

Teaching resources

Official website: https://www.magicschool.ai/

Activity / goal

Create a lesson plan for classification algorithms

Example prompt or task

“Create a 45-minute lesson for first-year students with objectives, a simple example, a group activity, and a short exit quiz.”

Solution steps — follow in order

1. Open MagicSchool and choose a lesson-plan or teaching-resource tool.
2. Enter subject, student level, lesson duration, and learning objectives.
3. Paste the example prompt or fill the relevant fields in the tool.
4. Generate the draft and review the sequence, timing, examples, and assessment.
5. Edit for curriculum alignment, accessibility, and the students' prior knowledge.
6. Use the lesson only after checking technical accuracy and suitability.

Important check: Teacher review is essential; avoid entering identifiable student information without authorization.

Wayground (formerly Quizizz)

Quiz and assessment creation

Official website: https://wayground.com/

Activity / goal

Create an SQL joins quiz

Example prompt or task

“Create 10 beginner-level multiple-choice questions on SQL joins, each with four options, one correct answer, and a short explanation.”

Solution steps — follow in order

1. Open Wayground and choose a quiz or assessment creation option.
2. Enter the topic or provide approved learning material, then select learner level and question count.
3. Generate the questions using the available AI-assisted workflow.
4. Review every question, option, correct answer, and explanation. Correct any ambiguity.
5. Preview the quiz as a learner and test scoring settings.
6. Assign or present it, then use the results to identify concepts that need reteaching.

Important check: Verify every answer before using the quiz for formal grading.

Kahoot!

Gamified classroom learning

Official website: https://kahoot.com/

Activity / goal

Create a prompt-engineering revision game

Example prompt or task

“Create 10 questions covering zero-shot, few-shot, role-based, constraint-based, and output-format prompting.”

Solution steps — follow in order

1. Open Kahoot! and sign in or create an account.
2. Choose Create and select a quiz or available AI-assisted creation option.
3. Enter the topic or upload/paste permitted study material if supported.
4. Set answer choices, correct answers, timing, and points.
5. Preview the game and correct errors or confusing distractors.
6. Host the game and review response patterns to revisit difficult topics.

Important check: Check current plan limits and avoid exposing student identities in public game names.

Diffit

Differentiated teaching materials

Official website: https://web.diffit.me/

Activity / goal

Adapt a climate-change explanation for beginners

Example prompt or task

“Adapt this explanation for beginner learners. Create a simpler reading passage, key vocabulary, and five comprehension questions.”

Solution steps — follow in order

1. Open Diffit and choose a supported way to provide a topic or text.
2. Enter the topic or paste source text that you have permission to use.
3. Choose the target reading level and desired resources.
4. Generate the adapted passage, vocabulary, and questions.
5. Review scientific accuracy, reading level, answer keys, and source alignment.
6. Download or copy the material and adapt it to your lesson.

Important check: Check the adapted content for accuracy and source permissions.

Curipod

Interactive lesson creation

Official website: https://curipod.com/

Activity / goal

Create an interactive responsible-AI lesson

Example prompt or task

“Create a 20-minute lesson with an opening poll, three discussion questions, one scenario, and an exit ticket.”

Solution steps — follow in order

1. **1.** Open Curipod and create a lesson from a topic or prompt.
2. **2.** Specify audience, duration, learning objective, and interaction types.
3. **3.** Generate the first lesson draft and preview each slide/activity.
4. **4.** Edit the questions, scenario, and instructions to match your learners.
5. **5.** Test the lesson flow and confirm the total duration is realistic.
6. **6.** Present it and use responses to guide a discussion or follow-up activity.

Important check: Review AI-generated content and follow school privacy rules.

Brisk Teaching

Teacher workflow assistance

Official website: https://www.briskteaching.com/

Activity / goal

Give feedback on an anonymized student paragraph

Example prompt or task

“Use this rubric to give constructive feedback: one strength, two improvement areas, and one revision exercise.”

Solution steps — follow in order

1. Open the official Brisk Teaching website and review the supported browser or school setup.
2. Choose a feedback or writing-support workflow available in your account.
3. Provide an anonymized paragraph and the assessment rubric; remove names and identifying details.
4. Generate the feedback and inspect it for fairness, specificity, and respectful tone.
5. Revise suggestions so they align with the rubric and the student's learning needs.
6. Use teacher judgment for any grading or consequential evaluation.

Important check: Do not let AI alone make consequential student evaluations; protect student records.

Eraser

Technical diagrams and documentation

Official website: https://www.eraser.io/

Activity / goal

Draw a RAG architecture diagram

Example prompt or task

“Draw a document Q&A system: upload PDF, extract text, chunk, embed, store vectors, retrieve relevant chunks, generate an answer, show citations.”

Solution steps — follow in order

1. Open Eraser and create a new diagram or document.
2. Choose an architecture/flowchart workflow or available AI diagram feature.
3. Paste the example prompt and name the components clearly.
4. Generate the diagram and inspect every node, arrow, and label.
5. Ask for edits to show boundaries, external services, security controls, or failure paths.
6. Export the diagram and ask a technical reviewer to verify that it matches the real design.

Important check: AI diagrams may omit security, scaling, and failure-handling components.

Whimsical

Flowcharts and mind maps

Official website: https://whimsical.com/

Activity / goal

Map a customer support workflow

Example prompt or task

“Create a flowchart: receive ticket, classify issue, check priority, assign team, resolve, confirm with customer, close or escalate.”

Solution steps — follow in order

1. Open Whimsical and create a flowchart or mind map.
2. Paste the process description into the available AI/diagram workflow or build the first shapes manually.
3. Review each decision point and add branches for yes/no or escalation outcomes.
4. Add responsible roles and the expected result at each step.
5. Check that every path reaches a valid end state and that exceptions are covered.
6. Share or export the diagram after validating it with someone who knows the process.

Important check: Check all decision branches and exceptions before treating it as an operating procedure.

Lucidchart

Process and system diagrams

Official website: https://www.lucidchart.com/

Activity / goal

Map a hiring workflow

Example prompt or task

“Map hiring from application through screening, interview, decision, offer, and onboarding. Show decision branches and responsible roles.”

Solution steps — follow in order

1. Open Lucidchart and create a new diagram.
2. Choose a flowchart/process map template or an available AI diagram feature.
3. Enter the hiring stages, decision points, and role names.
4. Inspect the generated sequence and correct labels, arrows, and branches.
5. Add exception paths such as rejection, candidate withdrawal, or a delayed decision if relevant.
6. Ask the process owner to validate the diagram before publishing it.

Important check: Do not include confidential candidate details in shared diagrams.

Jotform

Online forms and registration

Official website: https://www.jotform.com/

Activity / goal

Create a workshop registration form

Example prompt or task

“Create a form with name, email, organization, experience level, preferred session, optional accessibility needs, and consent checkbox.”

Solution steps — follow in order

1. Open Jotform and choose to create a form or use an available AI form builder.
2. Describe the form's purpose and enter the requested fields.
3. Set required/optional fields, validation rules, and a confirmation message.
4. Preview the form on desktop and mobile, then submit a test response.
5. Check notification recipients, response access, consent language, and data retention settings.
6. Publish and share the form only after confirming privacy and access controls.

Important check: Collect only necessary information and follow privacy requirements.

Typeform

Conversational surveys

Official website: https://www.typeform.com/

Activity / goal

Create a post-workshop feedback survey

Example prompt or task

“Ask about content relevance, trainer clarity, hands-on usefulness, confidence gained, and one open-ended suggestion.”

Solution steps — follow in order

1. Open Typeform and create a new form or survey.
2. Add concise, neutral questions and select appropriate response types.
3. Use branching only when it improves the respondent experience.
4. Preview the full survey and test it on mobile.
5. Check required fields, anonymity claims, consent, and who can view responses.
6. Publish and review results in aggregate while protecting participant privacy.

Important check: Avoid leading questions and unnecessary personal-data collection.

Tally

Simple forms and data collection

Official website: https://tally.so/

Activity / goal

Create a project-submission form

Example prompt or task

“Create a form with team name, project title, problem statement, tools used, repository link, and a checkbox confirming no confidential data is included.”

Solution steps — follow in order

1. Open Tally and create a new form.
2. Add the fields in the order participants should complete them.
3. Set required fields, helper text, and any conditional logic needed.
4. Preview the form and submit a sample response.
5. Check who can access responses and how notifications or exports work.
6. Share the form after confirming privacy, access, and retention settings.

Important check: Do not collect sensitive information unless necessary and authorized.

Meshy

AI 3D asset generation

Official website: https://www.meshy.ai/

Activity / goal

Generate a low-poly educational robot

Example prompt or task

“Generate a low-poly educational robot with simple geometric body, separate arms and legs, and neutral materials for a beginner game prototype.”

Solution steps — follow in order

1. Open Meshy and choose an available text-to-3D or image-to-3D workflow.
2. Enter a detailed prompt describing shape, style, materials, and intended use.
3. Generate the model and inspect the preview from multiple angles.
4. Refine the prompt or use available editing tools to correct proportions and textures.
5. Export in a supported format and import it into your target 3D application.
6. Check geometry, scale, texture quality, and license terms before using it in a project.

Important check: Generated geometry may need cleanup; check output rights before commercial use.

Spline

Interactive 3D scenes

Official website: https://spline.design/

Activity / goal

Create an interactive 3D event visual

Example prompt or task

“Create a 3D event scene with floating geometric shapes and a central glowing sphere that rotates gently on hover.”

Solution steps — follow in order

1. **1.** Open Spline and create a new scene or choose an available AI-assisted workflow.
2. **2.** Add objects or describe the scene, lighting, camera, and desired interaction.
3. **3.** Arrange objects and set interaction behavior using available controls.
4. **4.** Preview the scene and test interactions with mouse/touch if supported.
5. **5.** Check loading performance and readability at different screen sizes.
6. **6.** Publish or export using available options and verify embedding and sharing settings.

Important check: Keep scenes lightweight and review accessibility and licensing before publishing.

Krea

Visual ideation and enhancement

Official website: https://www.krea.ai/

Activity / goal

Create a smart-classroom concept image

Example prompt or task

“Create a polished concept image of a future smart classroom, collaborative desks, subtle digital displays, warm natural light, no logos or readable text.”

Solution steps — follow in order

1. Open Krea and select an available image-generation or enhancement tool.
2. Enter a prompt describing the subject, composition, style, lighting, and exclusions.
3. Generate several variations and choose one that fits the goal.
4. Refine details with focused instructions or supported enhancement controls.
5. Inspect for artifacts, unwanted text, and inaccurate details.
6. Download the reviewed result and check current usage rights before publishing.

Important check: Feature availability and output rights depend on the current product and plan.

Luma AI

AI video and visual scene generation

Official website: https://lumalabs.ai/

Activity / goal

Generate a short campus robot scene

Example prompt or task

“Create a short cinematic scene of a delivery robot moving through a campus courtyard at sunrise, smooth tracking camera, no logos.”

Solution steps — follow in order

1. Open Luma AI and choose an available video or visual generation workflow.
2. Enter a prompt describing subject, action, environment, camera movement, lighting, and intended mood.
3. Add a reference image only if you have permission to use it.
4. Generate the clip and inspect motion consistency, object shapes, and visual artifacts.
5. Adjust one or two prompt details and generate a revised version if needed.
6. Export using available options and check rights before publishing.

Important check: Check access, generation limits, and permissions for reference media.

Google Colab

Browser-based Python notebooks

Official website: https://colab.research.google.com/

Activity / goal

Create a beginner pandas notebook

Example prompt or task

“Load a sample CSV with pandas, show the first five rows, check missing values, plot a histogram, and explain each step.”

Solution steps — follow in order

1. Open Google Colab and create a new notebook.
2. Add a Markdown cell explaining the task and a code cell to import pandas and load a sample CSV.
3. Run the cells in order and inspect the first rows and missing-value summary.
4. Add a plotting cell and label the chart. Ask an AI assistant for help if you encounter an error.
5. Test with a small sample and ensure the notebook does not rely on unavailable local file paths.
6. Save the notebook and remove API keys or sensitive data before sharing it.

Important check: Never hard-code API keys or publish sensitive data in a notebook.

Webflow

Visual website builder

Official website: https://webflow.com/

Activity / goal

Plan a data analytics training landing page

Example prompt or task

“Create a responsive landing page with course outcomes, audience, agenda, instructor section, FAQs, and registration call to action.”

Solution steps — follow in order

1. Open Webflow and create a new site or choose a suitable template.
2. Build or generate the main sections: hero, outcomes, agenda, instructor, FAQ, and registration.
3. Replace sample content with verified details and add navigation links.
4. Preview desktop, tablet, and mobile layouts; test links and form behavior.
5. Check accessibility, SEO basics, privacy notices, and form handling.
6. Publish only after verifying the domain, hosting plan, and all public information.

Important check: Review form data handling, accessibility, and hosting costs before launch.

Framer

Website and landing-page builder

Official website: https://www.framer.com/

Activity / goal

Create a workshop landing page

Example prompt or task

“Create a landing page for a beginner-friendly AI workshop with a hero, learning outcomes, agenda, instructor placeholder, FAQs, and registration CTA.”

Solution steps — follow in order

1. **1.** Open Framer and create a new site or use an available AI start workflow.
2. **2.** Enter the audience, page sections, visual style, and main action.
3. **3.** Review the first page and edit headings, body text, images, and links.
4. **4.** Test mobile/tablet layout, navigation, and registration link behavior.
5. **5.** Replace all placeholders and verify date, venue, instructor, and contact details.
6. **6.** Publish after checking domain and plan requirements.

Important check: Do not publish placeholder claims or unverified event details.

Exa

Search API for AI applications

Official website: https://exa.ai/

Activity / goal

Retrieve official documentation for a research assistant

Example prompt or task

“Find official documentation about Python data validation and return each page title, URL, and a short relevance summary.”

Solution steps — follow in order

1. Open Exa's official website and read the current API quickstart.
2. Create an account or API key if required; store the key in an environment variable or secret manager.
3. Run a small example request using a narrow query and supported search options.
4. Inspect the returned URLs and open source pages to confirm relevance and freshness.
5. Add error handling, rate limits, and source attribution to your prototype.
6. Never commit the API key or expose it in a public notebook or repository.

Important check: Respect API rate limits and site terms; keep credentials secret.

Dify

LLM app and knowledge workflow builder

Official website: https://dify.ai/

Activity / goal

Build a policy Q&A prototype

Example prompt or task

“Create a policy Q&A app that answers from an approved HR handbook, shows sources, and says when the answer is not in the handbook.”

Solution steps — follow in order

1. Open Dify and create an app or workflow using the available builder.
2. Configure a supported model provider through the credential settings.
3. If using document retrieval, create a knowledge base and upload approved sample documents.
4. Write instructions that require answers to use retrieved content and identify missing evidence.
5. Test questions answered by the handbook, questions absent from it, and conflicting passages.
6. Set access controls and review costs before sharing the app.

Important check: Check data retention, access controls, retrieval quality, and model costs before using company documents.

Flowise

Visual LLM/RAG workflow builder

Official website: https://flowiseai.com/

Activity / goal

Create a document question-answering flow

Example prompt or task

“Build a basic flow with document loader, text splitter, embeddings, vector store, retriever, LLM, and answer output.”

Solution steps — follow in order

1. Open Flowise and create a new chatflow or workflow.
2. Add the required loader, splitter, embedding, vector-store, retrieval, and model nodes supported by your setup.
3. Connect nodes in the correct sequence and configure credentials securely.
4. Load a small, non-sensitive document and test a question whose answer is present in it.
5. Inspect retrieved chunks and test a question whose answer is missing.
6. Add authentication and safe error handling before exposing the endpoint to other users.

Important check: Protect endpoints and credentials, and verify that answers are grounded in retrieved text.

LlamaIndex

RAG and knowledge-data development

Official website: https://www.llamaindex.ai/

Activity / goal

Build a PDF Q&A proof of concept

Example prompt or task

“Create a Python prototype that indexes approved PDFs and answers questions with citations to the source file or page.”

Solution steps — follow in order

1. Open the LlamaIndex documentation and select a current starter example for document loading and querying.
2. Create a Python environment and install the packages required by that example.
3. Prepare a small set of approved PDFs and configure the model/embedding credentials securely.
4. Run the indexing step, then query the index and inspect retrieved source chunks.
5. Ask questions with answers present, absent, and potentially conflicting in the documents.
6. Return source references with answers and document any limitations before sharing the prototype.

Important check: APIs and package names can change; follow current docs and protect source data and keys.

CrewAI

Multi-agent workflow framework

Official website: https://www.crewai.com/

Activity / goal

Prototype a research workflow with reviewer agent

Example prompt or task

“Design a workflow with a researcher to gather sources, an analyst to compare findings, and a reviewer to flag unsupported claims. Require human approval before publishing.”

Solution steps — follow in order

1. Open CrewAI's official documentation and follow the current installation quickstart.
2. Create a small project and define one clear objective and output format.
3. Define agent roles, task descriptions, and the tools each agent is permitted to use.
4. Specify task order and what output one agent passes to the next.
5. Run the workflow on a small topic and inspect sources, handoffs, errors, and cost.
6. Add human approval and tool restrictions before using it for consequential or external actions.

Important check: Multi-agent workflows can multiply errors and costs; restrict tools and verify evidence.

LangGraph

Stateful agent workflow framework

Official website: https://www.langchain.com/langgraph

Activity / goal

Build a support-ticket workflow with human approval

Example prompt or task

“Classify a support ticket, retrieve approved knowledge, draft a reply, request human approval, and only then send the reply.”

Solution steps — follow in order

1. Open the official LangGraph documentation and follow a current getting-started example.
2. Define the workflow state: ticket text, category, retrieved evidence, draft response, and approval status.
3. Create nodes for classification, retrieval, drafting, and human review; connect them with explicit transitions.
4. Add conditional paths for missing information, low confidence, and tool failures.
5. Test normal, ambiguous, and failure cases and inspect the state at each step.
6. Keep sending actions behind explicit human approval and log the final outcome.

Important check: Use current docs and gate side-effecting tools with permissions and human review.

A Simple Method for Any AI Tool

1. Define the outcome

Write one sentence describing what you want the tool to produce.

2. Provide context

State the audience, purpose, source material, and any constraints.

3. Generate a first result

Use the tool's main create, generate, analyze, or run action.

4. Test and refine

Check a normal case and an edge case; request a specific improvement.

5. Verify

Confirm facts, calculations, source citations, permissions, and privacy.

6. Export or share

Use the available download, export, publish, or share control only after review.
